

# Low Power Configurable Multiple-Function Gate

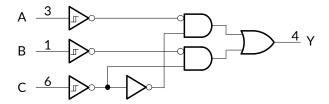

# **1 FEATURES**

- Operating Voltage Range: 1.65V to 5.5V
- Low Power Consumption:10µA (Max)
- Operating Temperature Range: -40°C to +125°C
- Inputs Accept Voltage to 5.5V
- High Output Drive: ±24mA at Vcc=3.0V
- I<sub>off</sub> Supports Live Insertion, Partial-Power-Down Mode, and Back-Drive Protection
- Micro SIZE PACKAGES: SOT23-6, SC70-6

# **2 APPLICATIONS**

- Cable Solutions
- Barcode Scanners
- E-Books
- Embedded PC
- Network-Attached Storage
- Video Communications Systems
- Servers
- Wireless Data Access Cards, Headsets, Keyboard, Mouse, and LAN Cards

# Logic Diagram (Positive Logic)

# **3 DESCRIPTIONS**

The RS1G97 configurable multiple-function gate is designed for 1.65V to 5.5V  $V_{\text{CC}}$  operation.

The RS1G97 device features configurable multiple functions. The output state is determined by eight patterns of 3-bit input. The user can choose the logic functions MUX, AND, OR, NAND, NOR, inverter, and noninverter. All inputs can be connected to  $V_{CC}$  or GND.

This device functions as an independent gate, but because of Schmitt action, it may have different input threshold levels for positive-going ( $V_{T+}$ ) and negative-going ( $V_{T-}$ ) signals.

The RS1G97 is fully specified for partial-power-down applications using  $I_{off}$ . The  $I_{off}$  circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

This device available in Green SOT23-6 and SC70-6 packages. It operates over an ambient temperature range of  $-40^{\circ}$ C to  $+125^{\circ}$ C.

Vcc	Supply voltage range		-0.5	6.5	V
VI	Input voltage range <sup>(2)</sup>		-0.5	6.5	V
Vo	Voltage range applied to any output in the high-impedar	nce or power-off state <sup>(2)</sup>	-0.5	6.5	V
Vo	Voltage range applied to any output in the high or low st	ate <sup>(2) (3)</sup>	-0.5	Vcc+0.5	V
I <sub>IK</sub>	Input clamp current VI<0			-50	mA
l <sub>ок</sub>	Output clamp current		-50	mA	
lo	Continuous output current		±50	mA	
	Continuous current through $V_{CC}$ or GND			±100	mA
Αlθ	SOT23-6			230	°C/W
ALO	Package thermal impedance <sup>(4)</sup> SC70-6			265	C/ VV
τ	Junction temperature <sup>(5)</sup>			150	°C
Tstg	Storage temperature		-65	150	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.

(3) The value of V<sub>cc</sub> is provided in the *Recommended Operating Conditions table*.

(4) The package thermal impedance is calculated in accordance with JESD-51.

(5) The maximum power dissipation is a function of  $T_{J(MAX)}$ ,  $R_{\theta JA}$ , and  $T_A$ . The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(MAX)} - T_A) / R_{\theta JA}$ . All numbers apply for packages soldered directly onto a PCB.

# 8.2 ESD Ratings

The following ESD information is provided for handling of ESD-sensitive devices in an ESD protected area only.

			VALUE	UNIT	
		Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 $^{(1)}$	±4000		
V(ESD) E	lectrostatic discharge	Charged-device model (CDM), per ANSI/ESDA/JEDEC JS-002 <sup>(2)</sup> ±1500 V			
		Machine model (MM) ±200			
				-	

(1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

# ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

# 9 ELECTRICAL CHARACTERISTICS

over recommended operating free-air temperature range (TYP values are at  $T_A = +25$ °C, Full=-40°C to 125°C, unless otherwise noted.)<sup>(1)</sup>

VOLTAGE WAVEFORMS PROPAGATION DELAY TIMES INVERTION AND NON INVERTING OUTPUTS

NOTES: A. CL includes probe and jig capacitance.

- B. Waveform 1 is for an output with internal conditions such that the output is low, except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high, except when disabled by the output control. C. All input pulses are supplied by generators having the following characteristics:  $PRR \le 10$  MHz, ZO = 50.
- D. The outputs are measured one at a time, with one transition per measurement.
- E.  $t_{\mathsf{PLZ}} \, \text{and} \, t_{\mathsf{PHZ}} \, \text{are the same as} \, t_{\mathsf{dis}}.$
- F.  $t_{\text{PZL}}$  and  $t_{\text{PZH}}$  are the same as  $t_{\text{en}}$
- G.  $t_{\mathsf{PLH}}$  and  $t_{\mathsf{PHL}}$  are the same as  $t_{\mathsf{pd}}.$
- H. All parameters and waveforms are not applicable to all devices.

#### Figure 1. Load Circuit and Voltage Waveforms

# **11 Detailed Description**

### 11.1 Overview

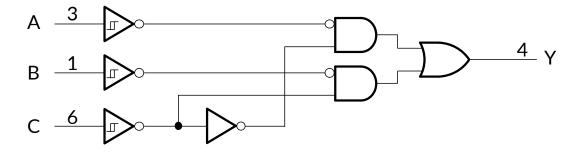

This configurable multiple-function gate is designed for 1.65V to 5.5V V<sub>CC</sub> operation.

The RS1G97 device features configurable multiple functions. The output state is determined by eight patterns of 3-bit input. The user can choose variations of common logic functions, like MUX, AND, OR, and NOT. All inputs can be connected to  $V_{CC}$  or GND.

This device functions as an independent gate, but because of Schmitt action, it may have different input threshold levels for positive-going ( $V_{T+}$ ) and negative-going ( $V_{T-}$ ) signals.

This device is fully-specified for partial-power-down applications using loff. The loff circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

# **11.2 Functional Block Diagram**

### **11.3 Feature Description**

The RS1G97 device has a wide operating V<sub>CC</sub> range of 1.65 V to 5.5 V, which allows use in a broad range of systems. The 5.5V I/O<sub>s</sub> allow down translation and also allow voltages at the inputs when V<sub>CC</sub> = 0 V.

### **11.4 Device Functional Modes**

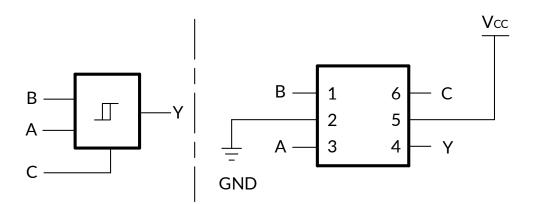

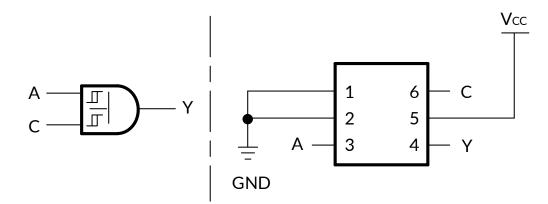

Figure 2. Two-Input MUX

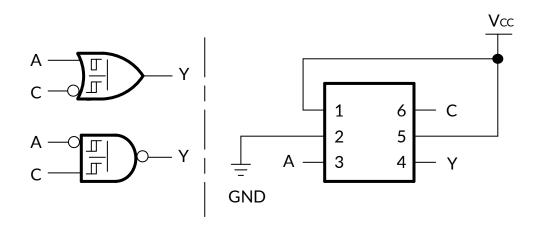

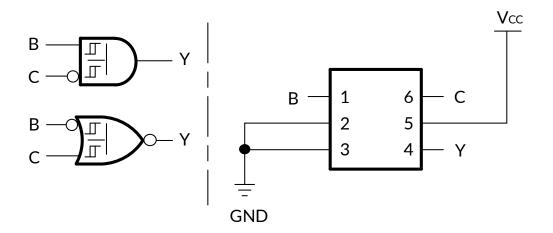

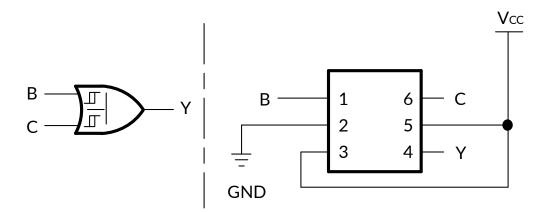

Figure 4. Two-Input OR with one input inverted or Two-Input NAND with one input inverted

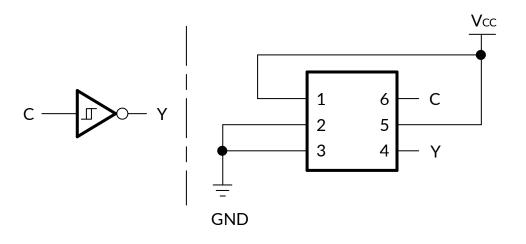

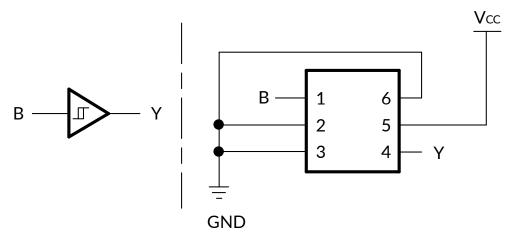

# **12 Application and Implementation**

Information in the following applications sections is not part of the RUNIC component specification, and RUNIC does not warrant its accuracy or completeness. RUNIC's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### **12.1 Application Information**

The RS1G97 device offers flexible configuration for many design applications. This example describes basic power sequencing using the AND gate configuration. Power sequencing is often used in applications that require a processor or other delicate device with specific voltage timing requirements in order to protect the device from malfunctioning.

### **12.2 Design Requirements**

This device uses CMOS technology and has balanced output drive. Care should be taken to avoid bus contention because it can drive currents that would exceed maximum limits.

The RS1G97 allows for performing logical Boolean functions with digital signals. Maintain input signals as close as possible to either 0 V or  $V_{CC}$  for optimal operation.

# **13 Power Supply Recommendations**

The power supply pin should have a good bypass capacitor to prevent power disturbance. For devices with a single supply, a 0.1uF capacitor is recommended and if there are multiple V<sub>CC</sub> terminals then 0.01uF or 0.022uF capacitors are recommended for each power terminal. It is acceptable to parallel multiple bypass caps to reject different frequencies of noise. The 0.1µF and 1µF capacitors are commonly used in parallel. The bypass capacitor should be installed as close to the power terminal as possible.

# 14 Layout

### **14.1 Layout Guidelines**

When using multiple bit logic devices, inputs should not float. In many cases, functions or parts of functions of digital logic devices are unused. Some examples are when only two inputs of a triple-input AND gate are used, or when only 3 of the 4-buffer gates are used. Such input pins should not be left unconnected because the undefined voltages at the outside connections result in undefined operational states.

Specified in Figure 9 are rules that must be observed under all circumstances. All unused inputs of digital logic devices must be connected to a high or low bias to prevent them from floating. The logic level that should be applied to any particular unused input depends on the function of the device. Generally, they will be tied to GND or  $V_{CC}$ , whichever makes more sense or is more convenient. It is acceptable to float outputs unless the part is a transceiver. If the transceiver has an output enable pin, it will disable the outputs section of the part when asserted. This will not disable the input section of the I/O<sub>S</sub> so they also cannot float when disabled.
