4-Bit Bidirectional Voltage-Level Translator for Open-Drain and Push-Pull Applications

1 FEATURES

- **Qualified for Automotive Applications**
- **AEC-Q100 Qualified with the Grade 1**
- **No Direction-Control**
- **Data Rates**
  24Mbps (Push-Pull)
  2Mbps (Open-Drain)
- **1.65V to 5.5V on A ports and 2.3V to 5.5V on B Ports ($V_{CCA} \leq V_{CCB}$)**
- **V_{CC} Isolation: If Either V_{CC} is at GND, Both Ports are in the High-Impedance State**
- **No Power-Supply Sequencing Required: Either V_{CCA} or V_{CCB} can be Ramped First**
- **I_{OFF}: Supports Partial-Power-Down Mode Operation**
- **Extended Temperature: -40°C to +125°C**

2 APPLICATIONS

- **Automotive Infotainment**
- **Advance Driver Assistance Systems (ADAS)**
- **Telematics**

3 DESCRIPTIONS

This 4-bit non-inverting translator is a bidirectional voltage-level translator and can be used to establish digital switching compatibility between mixed-voltage systems. It uses two separate configurable power-supply rails, with the A ports supporting operating voltages from 1.65V to 5.5V while it tracks the V_{CCA} supply, and the B ports supporting operating voltages from 2.3V to 5.5V while it tracks the V_{CCB} supply. This allows the support of both lower and higher logic signal levels while providing bidirectional translation capabilities between any of the 1.8V, 2.5V, 3.3V and 5V voltage nodes.

When the output-enable (OE) input is low, all I/Os are placed in the high-impedance state, which significantly reduces the power-supply quiescent current consumption. OE has an internal pull-down current source, as long as V_{CCA} is powered.

To ensure the high-impedance state during power up or power down, OE should be tied to GND through a pull-down resistor; the minimum value of the resistor is determined by the current-sourcing capability of the driver.
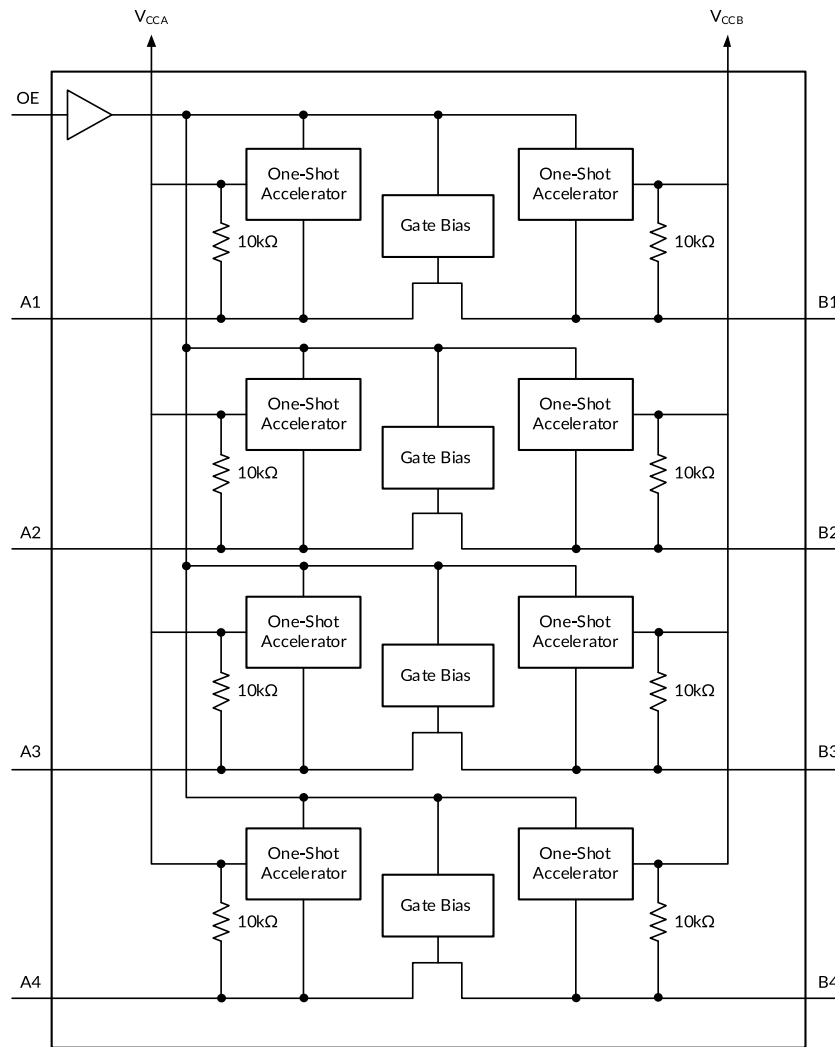

The RS0104-Q1 is available in Green UQFN1.7X2-12, TSSOP14 and QFN3.5X3.5-14 packages. It operates over an ambient temperature range of -40°C to +125°C.

Device Information [1]

PART NUMBER	PACKAGE	BODY SIZE (NOM)
RS0104-Q1	UQFN1.7X2-12	2.00mm×1.70mm
	TSSOP14	5.00mm×4.40mm
	QFN3.5X3.5-14	3.50mm×3.50mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

5 REVISION HISTORY

Note: Page numbers for previous revisions may different from page numbers in the current version.

| VERSION	Change Date	Change Item
A.0	2022/09/14	Preliminary version completed
A.1	2023/06/15	Initial version completed
A.1.1	2024/03/06	Modify packaging naming
A.2	2024/05/24	1. Add QFN3.5X3.5-14 Package 2. Update Switching Characteristics 3. Update PACKAGE OUTLINE DIMENSIONS

6 PACKAGE/ORDERING INFORMATION [1]

PRODUCT	ORDERING NUMBER	TEMPERATURE RANGE	PACKAGE LEAD	Lead finish/Ball material [2]	MSL Peak Temp [3]	PACKAGE MARKING [4]	PACKAGE OPTION
RS0104 -Q1	RS0104XUTQH12 -Q1	-40°C ~+125°C	UQFN1.7X2-12	NIPDAUAG	MSL1-260°-Unlimited	0104	Tape and Reel, 4000
	RS0104XQ -Q1	-40°C ~+125°C	TSSOP14	NIPDAUAG	MSL1-260°-Unlimited	RS0104	Tape and Reel, 4000
	RS0104XTQF14 -Q1	-40°C ~+125°C	QFN3.5X3.5-14	Plating Sn	MSL1-260°-Unlimited	RS0104	Tape and Reel, 5000

NOTE:

(1) This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the right-hand navigation.

(2) Lead finish/Ball material. Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(3) MSL Peak Temp. The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the lot trace code information (data code and vendor code), the logo or the environmental category on the device.

8 SPECIFICATIONS

8.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted) [1]

SYMBOL	PARAMETER		MIN	MAX	UNIT
V_{CCA}	Supply Voltage Range		-0.3	6.0	V
V_{CCB}	Supply Voltage Range		-0.3	6.0	V
V_I [2]	Input Voltage Range	A port	-0.3	6.0	V
		B port	-0.3	6.0	
		OE	-0.3	6.0	
V_O [2]	Voltage range applied to any output in the high-impedance or power-off state	A port	-0.3	6.0	V
		B port	-0.3	6.0	
V_O [2][3]	Voltage range applied to any output in the high or low state	A port	-0.3	V_{CCA}+0.3	V
		B port	-0.3	V_{CCB}+0.3	
I_{IK}	Input clamp current	$V_I<0$		-50	mA
I_{OK}	Output clamp current	$V_O<0$		-25	mA
I_O	Continuous output current			±50	mA
	Continuous current through V_{CCA}, V_{CCB} or GND			±100	mA
θ_{JA}	Package thermal impedance [4]	UQFN1.7X2-12		120	°C/W
		TSSOP14		121	
		QFN3.5X3.5-14		53	
T_J	Junction Temperature [5]		-40	150	°C
T_{stg}	Storage temperature		-65	+150	

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
(3) The value of V_{CCA} and V_{CCB} are provided in the recommended operating conditions table.
(4) The package thermal impedance is calculated in accordance with JESD-51.
(5) The maximum power dissipation is a function of $T_{J(MAX)}$, $R_{\theta JA}$, and T_A. The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A) / R_{\theta JA}$. All numbers apply for packages soldered directly onto a PCB.

8.2 ESD Ratings

The following ESD information is provided for handling of ESD-sensitive devices in an ESD protected area only.

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-Body Model (HBM), per AEC Q100-002 [1]	±2000	V
		Charged-Device Model (CDM), per AEC Q100-011	±1000	
		Latch-Up (LU), per AEC Q100-004	±100	mA

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.3 Recommended Operating Conditions

V_{CCI} is the supply voltage associated with the input port. V_{CCO} is the supply voltage associated with the output port.

PARAMETER	CONDITIONS		MIN	TYP	MAX	UNIT
Supply voltage [1]	V_{CCA}		1.65		5.5	V
	V_{CCB}		2.3		5.5	
High-level input voltage (V_{IH})	A-port I/Os	V_{CCA} = 1.65 V to 1.95 V V_{CCB} = 2.3 V to 5.5 V	V_{CCI} – 0.2		V_{CCI}	V
		V_{CCA} = 2.3 V to 5.5 V V_{CCB} = 2.3 V to 5.5 V	V_{CCI} – 0.4		V_{CCI}	V
	B-port I/Os	V_{CCA} = 1.65 V to 5.5 V V_{CCB} = 2.3 V to 5.5 V	V_{CCI} – 0.4		V_{CCI}	V
	OE input	V_{CCA} = 1.65 V to 5.5 V V_{CCB} = 2.3 V to 5.5 V	V_{CCA} × 0.8		5.5	V
Low-level input voltage (V_{IL})	A-port I/Os	V_{CCA} = 1.65 V to 5.5 V V_{CCB} = 2.3 V to 5.5 V	0		0.15	V
	B-port I/Os	V_{CCA} = 1.65 V to 5.5 V V_{CCB} = 2.3 V to 5.5 V	0		0.15	V
	OE input	V_{CCA} = 1.65 V to 5.5 V V_{CCB} = 2.3 V to 5.5 V	0		V_{CCA} × 0.25	V
Input transition rise or fall rate($\Delta t/\Delta v$)	A-port I/Os push-pull driving				10	ns/V
	B-port I/Os push-pull driving				10	ns/V
	Control input				10	ns/V
T_A Operating free-air temperature			-40		125	°C

(1) V_{CCA} must be less than or equal to V_{CCB}.

(2) The maximum V_{IL} value is provided to ensure that a valid V_{OL} is maintained. The V_{OL} value is V_{IL} plus the voltage drop across the pass gate transistor.

8.4 Electrical Characteristics

over recommended operating free-air temperature range (unless otherwise noted) [1] [2] [3]

PARAMETER		CONDITIONS	V_{CCA}	V_{CCB}	TEMP	MIN[4]	TYP[5]	MAX[4]	UNIT
V_{OHA}	Port A Output High Voltage	$I_{OH} = -20\ \mu A$ $V_{IB} \geq V_{CCB} - 0.4V$	1.65V to 5.5V	2.3V to 5.5V	Full	$V_{CCA} \times 0.7$		5.5	V
V_{OLA}	Port A Output Low Voltage	$I_{OL} = 1mA$ $V_{IB} \leq 0.15\ V$	1.65V to 5.5V	2.3V to 5.5V	Full			0.3	
V_{OHB}	Port B Output High Voltage	$I_{OH} = -20\ \mu A$ $V_{IA} \geq V_{CCA} - 0.2\ V$	1.65V to 5.5V	2.3V to 5.5V	Full	$V_{CCB} \times 0.7$			
V_{OLB}	Port B Output Low Voltage	$I_{OL} = 1mA$ $V_{IA} \leq 0.15\ V$	1.65V to 5.5V	2.3V to 5.5V	Full			0.3	
I_I	Input Leakage Current	OE	1.65V to 5.5V	2.3V to 5.5V	+25°C			±1	μA
					Full			±1.5	
I_{off}	Partial Power Down Current	A Ports	0V	0V to 5.5V	+25°C			±0.5	μA
					Full			±1	
		B Ports	0V to 5.5V	0V	+25°C			±0.5	μA
					Full			±1	
I_{OZ} [6]	High-Impedance State Output Current	A or B port OE=0V	1.65V to 5.5V	2.3V to 5.5V	+25°C			±0.5	μA
					Full			±1	
I_{CCA}	V_{CCA} Supply Current	$V_I = V_O$ = open $I_O = 0$	1.65V to V_{CCB}	2.3V to 5.5V	Full			1.0	μA
			5.5V	0V	Full			1.0	
			0V	5.5V	Full			-1	
I_{CCB}	V_{CCB} Supply Current	$V_I = V_O$ = open $I_O = 0$	1.65V to V_{CCB}	2.3V to 5.5V	Full			10	μA
			5.5V	0V	Full			-1	
			0V	5.5V	Full			1	
$I_{CCA} + I_{CCB}$	Combined Supply Current	$V_I = V_O$ = open $I_O = 0$	1.65V to V_{CCB}	2.3V to 5.5V	Full			15	μA
I_{CCZA}	V_{CCA} Supply Current	$V_I = V_{CCI}$ or 0V $I_O = 0$, OE=0V	1.65V to V_{CCB}	2.3V to 5.5V	Full			1	μA
I_{CCZB}	V_{CCB} Supply Current	$V_I = V_{CCI}$ or 0V $I_O = 0$, OE=0V	2.3V to 5.5V	2.3V to 5.5V	Full			1	μA
C_I	Input Capacitance	OE	3.3V	3.3V	+25°C		2.5		pF
C_{IO}	Input-to-Output Internal Capacitance	A port	3.3V	3.3V	+25°C		5		pF
		B port	3.3V	3.3V	+25°C		5		

(1) V_{CCI} is the V_{CC} associated with the input port.
(2) V_{CCO} is the V_{CC} associated with the output port
(3) V_{CCA} must be less than or equal to V_{CCB}.
(4) Limits are 100% production tested at 25°C. Limits over the operating temperature range are ensured through correlations using statistical quality control (SQC) method.
(5) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration.
(6) For I/O ports, the parameter I_{OZ} includes the input leakage current.

8.5 Timing Requirements

8.5.1 V_{CCA}=1.8V±0.15 V

9 PARAMETER MEASUREMENT INFORMATION

Unless otherwise noted, all input pulses are supplied by generators having the following characteristics:

• PRR 10 MHz

• Z_O = 50 Ω

• dv/dt ≥ 1 V/ns

Note: All input pulses are measured one at a time, with one transition per measurement.

10 FEATURE DESCRIPTION

10.1 Overview

The RS0104-Q1 device is a directionless voltage-level translator specifically designed for translating logic voltage levels. The A port is able to accept I/O voltages ranging from 1.65 V to 5.5 V, while the B port can accept I/O voltages from 2.3 V to 5.5 V. The device is a pass-gate architecture with edge-rate accelerators (one-shots) to improve the overall data rate. 10-kΩ pullup resistors, commonly used in open-drain applications, have been conveniently integrated so that an external resistor is not needed. While this device is designed for open-drain applications, the device can also translate push-pull CMOS logic outputs.

10.2 Architecture

The RS0104-Q1 architecture (see Figure 22) is an auto-direction-sensing based translator that does not require a direction-control signal to control the direction of data flow from A to B or from B to A. These two bidirectional channels independently determine the direction of data flow without a direction-control signal. Each I/O pin can be automatically reconfigured as either an input or an output, which is how this auto-direction feature is realized.

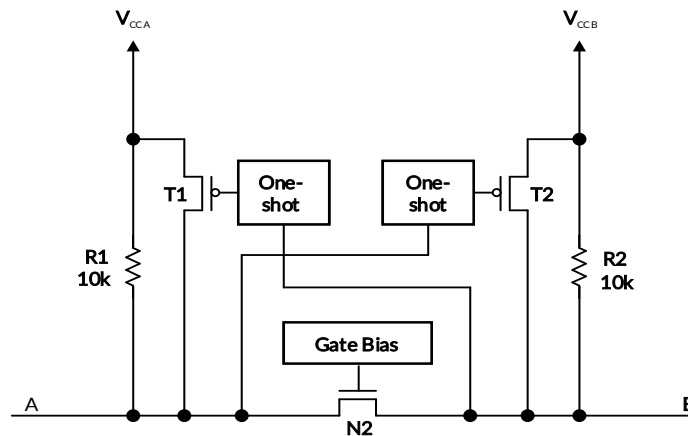

Figure 22. Architecture of a RS0104-Q1 Cell

The RS0104-Q1 employs two key circuits to enable this voltage translation:
1) An N-channel pass-gate transistor topology that ties the A-port to the B-port
2) Output one-shot (O.S.) edge-rate accelerator circuitry to detect and accelerate rising edges on the A or B Ports.

10.3 Input Driver Requirements

The continuous dc-current "sinking" capability is determined by the external system-level open-drain (or push-pull) drivers that are interfaced to the RS0104-Q1 I/O pins. Since the high bandwidth of these bidirectional I/O circuits is used to facilitate this fast change from an input to an output and an output to an input, they have a modest dc-current "sourcing" capability of hundreds of micro-Amps, as determined by the internal 10-kΩ pullup resistors.

The fall time (t_{fA}, t_{fB}) of a signal depends on the edge-rate and output impedance of the external device driving RS0104-Q1 data I/Os, as well as the capacitive loading on the data lines.

Similarly, the t_{PHL} and max data rates also depend on the output impedance of the external driver. The values for t_{fA}, t_{fB}, t_{PHL} and maximum data rates in the data sheet assume that the output impedance of the external driver is less than 50 Ω.

10.4 Output Load Considerations

We recommend careful PCB layout practices with short PCB trace lengths to avoid excessive capacitive loading and to ensure that proper O.S. triggering takes place. PCB signal trace-lengths should be kept short enough such that the round-trip delay of any reflection is less than the one-shot duration. This improves signal integrity by ensuring that any reflection sees a low impedance at the driver. The O.S. circuits have been designed to stay on for approximately 30 ns. The maximum capacitance of the lumped load that can be driven also depends directly on the one-shot duration. With very heavy capacitive loads, the one-shot can time-out before the signal is driven fully to the positive rail. The O.S. duration has been set to best optimize trade-offs between dynamic ICC, load driving capability, and maximum bit-rate considerations. Both PCB trace length and connectors add to the capacitance that the RS0104-Q1 device output sees, so it is recommended that this lumped-load capacitance be considered to avoid O.S. retriggering, bus contention, output signal oscillations, or other adverse system-level affects.

10.5 Enable and Disable

The RS0104-Q1 device has an OE input that is used to disable the device by setting OE low, which places all I/Os in the Hi-Z state. The disable time (t_{dis}) indicates the delay between the time when OE goes low and when the outputs are disabled (Hi-Z). The enable time (t_{en}) indicates the amount of time the user must allow for the one-shot circuitry to become operational after OE is taken high.

10.6 Pullup or Pulldown Resistors on I/O Lines

Each A-port I/O has an internal 10-kΩ pullup resistor to V_{CCA}, and each B-port I/O has an internal 10-kΩ pullup resistor to V_{CCB}. If a smaller value of pullup resistor is required, an external resistor must be added from the I/O to V_{CCA} or V_{CCB} (in parallel with the internal 10-kΩ resistors). Adding lower value pull-up resistors will affect V_{OL} levels, however. The internal pull-ups of the RS0104-Q1 are disabled when the OE pin is low.

11 APPLICATION AND IMPLEMENTATION

Information in the following applications sections is not part of the RUNIC component specification, and RUNIC does not warrant its accuracy or completeness. RUNIC's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

11.1 Application Information

The RS0104-Q1 device can be used to bridge the digital-switching compatibility gap between two voltage nodes to successfully interface logic threshold levels found in electronic systems. It should be used in a point-to-point topology for interfacing devices or systems operating at different interface voltages with one another. Its primary target application use is for interfacing with open-drain drivers on the data I/Os such as I_2C or 1-wire, where the data is bidirectional and no control signal is available. The device can also be used in applications where a push-pull driver is connected to the data I/Os, but the RS0104-Q1 might be a better option for such push-pull applications.
